

Multi Smelter

The multi smelter is a multiblock electric furnace capable to handle all furnace recipes and even process multiple of them in a single cycle.

Usage

When power is provided to the machine, it will begin smelting a certain amount of items depending on the tier of coils used, doubling at each tier and capping at 8192:

- Cupronickel: 8 items per cycle
- Kanthal: 16 items per cycle
- Nichrome: 32 items per cycle
- ...
- Eternal coils: 8192 items per cycle

As with all GregTech machines, these items are consumed at the beginning of the process and cannot be retrieved. If power is lost to the machine these items will be destroyed - so be sure your power supply is enough to power the Multi Smelter before use. Also, if the outputs of the recipes carries out exceeds the capacity of the output bus, it will automatically VOID all excess outputs. This is extremely common with smelting recipes that output nuggets, so make sure you have enough output space or have batches of inputs that are small enough.

If the player is trying to smelt two types of items at once, and there's enough parallels available, the multi smelter will process both of them in a single cycle.

There is also a Railcraft multiblock that does 9 items at a time via steam, the Steam Oven.
