

# Alloy Blast Smelter

## Introduction

The alloy blast smelter (ABS) is an IV-tier multiblock added by GT++. It is capable of producing molten alloys in a more efficient manner than the process of mixing then smelting in an EBF (20% faster than just an EBF). It is required in IV for making Indalloy 140.

## Construction

Similar to an EBF, with the same controller placement, but hatches, busses, maintenance, and mufflers can go on any casing. Blast smelter heat containment casing are used where coils usually would be on an EBF.The ABS can only accept one energy hatch and is *not* capable of overclocking. Use the mega ABS for that.

## Usage

Used to produce complex GT++ alloys. Bear in mind that usually alloys will be output in fluid form.
